New substance with a mdm2 binding domain and coupling partner - useful for stabilising in cells without an efficient mdm2-mediated degradation pathway. degradation

Disclosure; Fig 1; 52pp; English.

This sequence is a peptide homologue of a region of p53 which binds to mdm2. This peptide is used in the construction of a novel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in a population of cells. This agent is also used in the preparation of a therapeutic for activating p53, where the population of cells do not overexpress mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows level p53 to increase by reducing the clearance of p53 by mdm2, and can be used to activate p53 function. The agents for use in therapeutics for activating p53 can be used for the treatment of cancer, viral conditions or other conditions associated with non-functional p53

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence is a peptide homologue of a region of p53 which binds to mdm2. This peptide is used in the construction of a novel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in a population of cells. This agent is also used in the preparation of a therapeutic for activating p53, where the population of cells do not overexpress mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows levels of p53 to increase by reducing the clearance of p53 by mdm2, and can be used to activate p53 function. The agents for use in therapeutics for activating p53 can be used for the treatment of cancer, viral conditions or other conditions associated with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This represents a p53 N-terminal peptide fragment used in an Elisa TIP cassay for analysing the interaction between human oncogenic protein MDM2 and p53. The invention provides peptide derivatives capable of binding to the human MDM2. These peptides can specifically inhibit or block the binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting to the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated levels of MDM2. The peptides may be used to identify molecules that bind to to MDM2 and to identify and design inhibitors of MDM2, diagnose disease by measuring levels of MDM2 in blood of cancer and leukaemia patients and for treatment or prevention of disease involving p53/MDM2 interactions, especially tumours and viral infections. The peptides can be administered nasally, rectally, orally or by injection. By interfering with MDM2/p53 interaction, the peptides can activate p53 function and calls. The peptides which minic the MDM2 binding calls in p53, have a significantly greater blocking activity compared with
                                                                                                                                                                                                                                                                                                                                          Query Match

This peptide corresponds to residues 11-29 of human p53 (AMA47079). The interaction between p53 and Rb is found to be critical for determining whether or not a cell enters apoptosis. Apoptosis is prevented if interaction occurs. The interaction is between regions 1-71 or 290-393 of p53 and region 379-928 of Rb. The invention provides methods to identify compounds able to modulate interaction or binding between p53 and Rb protein. The method comprises combining p53 and Rb, or their fragments, with a test compound and detecting interaction/binding between p53 and Rb protein. The method and detecting interaction/binding between them. These inhibitory compounds are used in human or veterinary medicine to modulate p53 activity and processes, specifically for inducing apoptosis in tumour cells (possibly also in cells infected by virus), in vivo or in vitro. Expression of these modulators by gene therapy methods is also contemplated. Other activities that can be affected are transcription repression, G1 arrest, DNA repair, homologous recombination and 3'-5'-exonuclease activity. Modulation of interaction with Rb may also
                                                                                                                                                           24-FEB-2003
                                                                                                                                                                                                                       AAE30870 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a peptide for use in modulating the binding of a p53 polypeptide to a p300 polypeptide. The new peptide is useful in modulating the binding of a p53 polypeptide to a p300 polypeptide. The peptide may be used to regulate the mammalian cell cycle or to induce or prevent cell death, for the treatment of cancer or ischaemia. The invention is useful in gene therapy. The present sequence is a peptide used in modulating the binding of p53 to p300
                                                                                                                                                                                                                                                                                                       Human; p53; degradation; cervical cancer; tumour; ovarian cancer; glioma; carcinoma; squamous cell carcinoma; lung cancer; pancreatic cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptide for modulating the binding of p53 polypeptide to p300 polypeptide, useful for regulating the mammalian cell cycle for the treatment of cancer or ischemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hupp

The cell comprises an Mdm2 amplification or overexpresses Mdm2. A degradation resistant p53 polypeptide is useful for inhibiting tumour growth, where the tumour is a cervical cancer and comprises a p53 mutation. The polypeptide, and DNA encoding the polypeptide, are useful for treating cancer. This sequence represents a region of the human p53 polypeptide
The invention describes a composition (I) for assessing the presence of at least a first target molecule in a sample, comprising: several low-to moderate affinity binding elements distributed on a surface of, and operatively coupled to a support, where concomitant binding of the first target molecule to two or more of the binding elements results in a high
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a substantially pure polypeptide that inhibits degradation of endogenous p53 in a mammalian cell. The polypeptide or a synthetic polypeptide comprising a region of the pure polypeptide is useful for inhibiting degradation of endogenous p53 in a mammalian cell.
                                                                                                                                                                                                                                                         as polypeptide in sample e.g., blood, comprises several low-to-modern affinity binding elements distributed on surface of, and operatively coupled to support.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 19
                                                                                                                                                                                                                                                                                                                           Composition useful for assessing presence of first target molecule such as polypeptide in sample e.g., blood, comprises several low-to-moderate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diagnostic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mixed element capture agent study associated peptide Gal80bp.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       determining the presence of a target molecule, which is a modified component in a sample. The binding elements of (I) are useful: in the construction of medical diagnostic devices; research; medicine; military; (C) forensics; diagnostic application; detecting presence or absence of comultiple biological markers in complex samples such as blood or urine; and detecting components of a biological pathway. The binding elements of (I) interact with the target molecule with high affinity and specificity. (C) interact with the target molecule with high affinity and specificity. (C) enables detection of substances from a variety of samples in a rapid this throughput format. The binding elements of (I) are easily produced in large quantities with efficient quality control and can be easily ctallored to allow attachment to surfaces. (I) provides an easy, control to allow attachment to surfaces. (I) provides an easy, control to allow attachment to surfaces. (I) provides an easy, control and can be easily control to allow attachment to surfaces. (I) provides an easy, control and can be easily control to allow attachment to surfaces. (I) provides an easy, control and can be easily control to allow attachment to surfaces. (I) provides an easy, control and can be easily control to the easily produced control to the control of target and control and control and can be easily control and ca

This invention relates to a novel stabilized alpha-helix peptide structure which comprises a selected number of any combination of natural and unnatural amino acids (where the peptide further comprises at least one cross-linking moiety that stabilizes the peptide in alpha-helix conformation). The invention may be useful for the development of compounds with a cytostatic or virucide activity acting as a cell proliferation inhibitor, viral replication inhibitor, gene expression or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a peptide for use in modulating the binding of a p53 polypeptide to a p300 polypeptide. The new peptide is useful in modulating the binding of a p53 polypeptide to a p300 polypeptide. The peptide may be used to regulate the mammalian cell cycle or to induce or prevent cell death, for the treatment of cancer or ischaemia. The invention is useful in gene therapy. The present sequence is BOX-1 domain
                                                                                                                                                                                                              New stabilized alpha-helix peptide structure useful in medicinal chemistry as therapeutic agents comprises selected number of any combination of natural and unnatural amino acids, where the peptifurther comprises cross-linking moieties.
                                                                                                                                                                          Disclosure;

The stabilized alpha-helix peptide structure generates stabilized-helical structures, as well as other secondary structures, to enable the investigation of complex structure-function relationships in proteins and enable the development of new therapeutics incorporating specific stabilized secondary structure motifs. The peptides can be synthesized one-at-a time, using a traditional peptide to generate the structure motif, and may control (promote or inhibit) cell functions. The present sequence is that of a peptide which was used during the exemplification of the novel stabilized alpha-helix peptide structures of the invention.
                                       This synthetic peptide corresponds to amino acids 13-27 of human p53. It was used to raise anti-peptide p53.1 and anti-RB18A antibodies in rabbit. RB18A (see AAY06309) is a novel p53 regulatory protein of the invention. The antibodies were used in immunoscreenings that led to the isolation of a CDNA clone (see AAX59124) encoding human RB18A. The invention provides methods and compositions for the diagnostic and therapeutic applications of RB18A, in particular for the diagnosis, prevention or treatment of

(I) comprises: (a) a CC detecting binding of a molecule of interest. (I) comprises: (a) a constitution domain; (b) a first localisation domain; and (c) a binding CC domain for the molecule of interest. The detection domain, the first CC constituting the recombinant fusion protein for detecting binding of a molecule of interest are operably linked. The binding domain for the molecule of interest is separated from the first localisation domain by 0 cd. amino acid residues. The first localisation domain by 0 cd. amino acid residues. The first localisation domain by 0 cd. amino acid residues. The first localisation domain by 0 cd. amino for the molecule of interest both do not occur in a single non-recombinant protein with the same spacing as in the recombinant fusion protein; (c) a recombinant nucleic acid encoding the recombinant fusion protein; (c) a recombinant encoding the recombinant fusion protein; (c) a recombinant encoding the recombinant fusion protein; (c) a recombinant encoding the nucleic acid control companies operably linked to the recombinant nucleic acid control companies operably linked to the recombinant nucleic acid control companies of the molecule of interest; and (5) a method for identifying compounds that alter the binding of the molecule of interest. The recombinant fusion protein is constant for detecting binding of a molecule of interest. The recombinant fusion protein and enables the need to construct two or more chimeric proteins and enables the monitoring of biochemical events in live, interest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The present sequence is that of a peptide (PNC27) comprising amino aci residues 12-26 of human p53. The invention provides peptides corresponding to all or a portion ADG78884-ADG78885 of this sequence, peptides being lethal to malignant or transformed cells when fused to membrane-penetrating leader sequence. The peptides are thus useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; p53; cytostatic.

    penetrating leader sequence. The peptides are derived from the human p53 composition. Also disclosed are (i) a pharmaceutical composition comprising at least one of the peptides or its analogues or derivatives admixed with a pharmaceutical carrier, and (ii) a method of selectively killing malignant or neoplastic cells in a subject. The leader sequence is preferably located at the carboxy terminal end of the peptide, its analogue or derivative. The leader sequence comprises predominantly positively charged amino acid residues. The leader sequence is at least one of penetratin, Args, TAT of HIVI, D-TAT, R-TAT, SV40-NLS, CCMV GAG, p22N, Lambda N, Delta N, yeast PRP6, human U2AF, human C-FOS, human C-JUN, yeast GCN4 or p-vec. Selectively killing malignant or neoplastic cells in a subject comprises administering to the subject an amount of the peptide, where a membrane-penetrating leader sequence is fused to the carboxy terminal of the peptide, its analogue or derivative. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     treating neoplastic disease in an animal, preferably a human. Claimed methods of selectively killing malignant or neoplastic cells comprise administering the p53-derived peptide fused at its C-terminus to a membrane-penetrating leader sequence, such as the penetratin leader
                                                                                                                                                                                                                                            The present invention relates to peptides that are selectively lethal malignant and transformed mammalian cells when fused to a membrane-
                                                                                                                                                                                                                                                                                                                                        New peptide fused to membrane-penetrating leader sequence and selectively lethal to malignant or transformed cells, useful 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      membrane-penetrating sequence ADG78886.
                                                                                                                                                                                                                                                                                               Claim
                                                                                                                                                                                                                                                                                                                                                                                         WPI; 2004-203289/19.

                                                                                                                                                                                                                                                                                                                           3C4-Ag in substantially purified form, which has a molecular weight of 4.5 ADA as determined by SDS-PAGE, and a pI on isoelectrofocusing of 4.5 -5.0. The antigen is unglycosylated or minimally glycosylated and is primarily localised on the surface of rat and human pancreatic cancer cells but is not detected in normal, non-proliferating cells. Also described: (1) a soluble pancreatic carcinoma-specific antigen 3C4-Ag having a molecular weight of 36-38 kDa as determined by SDS-PAGE which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New pancreatic carcinoma-specific antigen 3C4-Ag primarily localized on

                                                                                                                                                                                                    (8) treating pancreatic cancer in a patient by administering an effective amount of an antibody or its binding portion which specifically binds to 3C4-Ag or its immunologically active fragment, where the antibody or binding portion is conjugated or linked to a therapeutic drug or texin; and (9) a pharmaceutical composition comprising the antibody or its binding portion, and a carrier. The pancreatic carcinoma-specific antigen 3C4-Ag has cytostatic activity, and can be used as an immunotoxin. The antigen and methods are useful for detecting and treating pancreatic cancer. The present sequence represents a pancreatic cancer associated antigen peptide, which is used in the exemplification of the present

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-08-277-660A-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Patent No. 5//00
GENERAL INFORMATION:
APPLICANT: Picksley, Steven M.
APPLICANT: Lane, David P.
APPLICANT: Lane, David P.
TITLE OF INVENTION: Interruption of Binding of MDM2 and P53
TITLE OF INVENTION: Protein and Therapeutic Application Thereof
TITLE OF INVENTION: 50
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

Sequence 63, Application US/09695437A
Patent No. 6803203
GENERAL INFORMATION:
APPLICANT: Brookhaven Science Associates
APPLICANT: Anderson, Carl W
APPLICANT: Connelly, Margery A
TITLE OF INVENTION: DNA-PK Assay
FILE REFERENCE: BSA 01-02
CURRENT FILING DATE: 2000-10-24
PRIOR APPLICATION NUMBER: US/09/695,437A
PRIOR APPLICATION NUMBER: US/09/695,437A
PRIOR APPLICATION NUMBER: US/09/695,437A
PRIOR APPLICATION NUMBER: US/09/695,437A
